Nature 374:736-739(1995).

-!- FUNCTION: In the presence of an appropriate stimulus, accelerates programmed cell death by binding to, and antagonizing the a repressor Bcl-2 or its adenovirus homolog BIB 19k protein.

-!- SUBUNIT: Forms heterodimers with Bcl-2, EIB 19k protein, and Bcl-

1. SUBCELLULAR LOCATION: Membrane-associated (Potential).

1. TISSUE SPECIFICITY: Expressed in a wide variety of tissues, with highest levels in the heart and skeletal muscle.

1. DOMAIN: Intact BH3 domain is activity and for their interaction with anti-apoptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.

2. SIMILARITY: Belongs to the Bcl-2 family. Apoptotic members of the Bcl-2 family.

3. SIMILARITY: Contains 1 Bcl-2 homology 1 (BH1) domain.

4. SIMILARITY: Contains 1 Bcl-2 homology 2 (BH2) domain.

5. CAUTION: This is probably the product of a pseudogene.

7. CAUTION: This is probably the product of through a collaboration between the Swiss Institute of Bolinformatics and the EMB1 outstation the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@lib.cib.ch).

                                                                                                                                                                                                                                                                                                                                                                                                  -!- SUBCELLULAR LOCATION: Membrane-bound (Potential).
-!- INSUB SPECIFICITY: Expressed in a wide variety of tissues, with highest levels in the heart and skeletal muscle.
-!- DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD and BAK for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.
-!- SIMILARITY: Conteains 1 Bcl-2 family.
-!- SIMILARITY: Conteains 1 Bcl-2 homology 2 (BH2) domain.
-!- SIMILARITY: Conteains 1 Bcl-2 homology 3 (BH3) domain.

                       -!- CATALYTIC ACTIVITY: ATP + D-fructose 6-phosphate = ADP + D-fructose 1,6-bisphosphate.
-!- PATHWAY: Key control step of glycolysis.
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: Belongs to the phosphofructokinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Xanthomonas axonopodis (pv. citri).

US-09-877-476-30

Sequence 30, Application US/09877476

Patent No. 6713664

GENERAL INFORMATION:

APPLICANT: Jaworski, Jan G.

TITLE OF INVENTION: SYNTHASE POLYPERTIDES

FILE REFERENCE: 07148-108001

CURRENT FILING DATE: 2010-06-08

PRIOR APPLICATION NUMBER: US 60/210,326

PRIOR APPLICATION NUMBER: US 60/210,326

PRIOR APPLICATION NUMBER: 2000-06-08

PRIOR PLING DATE: 2000-06-08

SEQ ID NO 30

LENGTH: 506
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 15

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
